

MATERIALS METHOD

SUBJECT: QUALITY ASSURANCE PROGRAM FOR PLAIN, STEEL LAMINATED, FABRIC LAMINATED AND SLIDING ELASTOMERIC BRIDGE BEARINGS

APPROVED:

CODE:

7.42-1

I. Scope

This method describes specific procedures for the quality assurance of elastomeric bridge bearings manufactured for Department projects. It encompasses a strict control system whereby only those bearings designed and therefore designated for specific projects are inspected, sampled and tested for eventual shipment to that project.

Bridge bearings with a design plan area of 650 square inches or less will be considered for acceptance strictly in conformance with the details of this procedure. Bearings designed with a plan area greater than 650 square inches will also be considered as detailed in this procedure except that some of the testing may be performed by a laboratory designated and approved by the Department, rather than by the Materials Bureau.

III. Definitions

A. Manufacturer

A company actually engaged in the production of elastomeric bearings at a given location.

B. Department

The New York State Department of Transportation.

C. Deputy Chief Engineer (Structures)

An official of the Department of Transportation who may be contacted by mailing to:

Deputy Chief Engineer (Structures)
New York State Department of Transportation
Building #5 - State Campus
1220 Washington Avenue
Albany, N.Y. 12232

or by telephoning (518) 457-6825.

D. Materials Bureau

A facility of the New York State Department of Transportation which may be contacted by mailing to:

Director, Materials Bureau
New York State Department of Transportation
Building 7A - Room 200
1220 Washington Avenue
Albany, New York 12232

or by telephoning the Materials Administration Office of the Materials Bureau at (518) 457-5642.

E. Inspection Authority

An office designated by the Materials Bureau as responsible for inspection control on behalf of the Department at specific manufacturing locations.

F. Plant Inspector

An individual employed by the Inspection Authority and approved by the Materials Bureau to function on inspection assignments in behalf of the Department.

Subject: QUALITY ASSURANCE PROGRAM FOR PLAIN, STEEL LAMINATED, FABRIC LAMINATED AND SLIDING ELASTOMERIC BRIDGE BEARINGS

G. Plain Elastomeric Bridge Bearing

A bearing composed entirely of elastomeric material cast in a mold under pressure and heat. A bearing may also be cut from a larger piece of elastomeric material. Any external load bearing steel plate(s) shall be factory vulcanized to the elastomeric bearings during the primary molding process.

H. Steel Laminated Elastomeric Bridge Bearings

A bearing composed of multiple laminates of elastomeric material separated by steel plates. The bearings shall be cast as a unit or cut from a larger section that has been cast as a unit in a mold under pressure and heat. The steel plates separating the elastomeric layers shall be completely bonded by vulcanization to the elastomeric material on all surfaces. Any external load bearing steel plate(s) shall be factory vulcanized to the elastomeric bearings during the primary molding process.

I. Fabric Laminated Elastomeric Bridge Bearings

A bearing composed of multiple laminates of elastomeric material separated by fabric sheets. The bearings shall be cast as a unit or cut from a larger section that has been cast as a unit in a mold under pressure and heat. The fabric sheets separating the elastomeric layers shall be completely bonded by vulcanization to the elastomeric material on all surfaces. Any external load bearing steel plate(s) shall be factory vulcanized to the elastomeric bearings during the primary molding process.

J. Sliding Elastomeric Bridge Bearing

A bearing consisting of a plain or steel laminated elastomeric element bonded to a lower steel bearing plate. To allow movement, the upper surface of the element shall be faced with a steel backed, polytetrafluoroethylene (PTFE) sheet and support a sliding top bearing plate. The mating surface of the top steel bearing plate shall be faced with polished stainless steel.

K. Lot

One or more bearings of the same item and size manufactured in a reasonably continuous manner in accordance with Department approved drawings.

L. Forms

The following forms are published by the Department for use by the Materials Bureau and Inspection Authorities.

1. BR-240 Sample and Acceptance Transmittal

This form transmits the inspector's sample information to the Materials Bureau and, upon validation, conveys acceptance/rejection action to the inspector. Detailed instructions for proper completion and transmittal are contained in Materials Method N.Y. 18.1.

2. BR-241, Transmittal Envelope

This is a heavy duty envelope used to contain the BR-240.

SDOT

Library
50 Wolf Road, POD 34
Albany, New York 12232

Subject: QUALITY ASSURANCE PROGRAM FOR PLAIN, STEEL LAMINATED, FABRIC LAMINATED AND SLIDING ELASTOMERIC BRIDGE BEARINGS

3. BR-195, Shipment Authorization

This form, executed by the inspector, accompanies all shipments by the supplier to the project. Detailed instructions for proper completion and transmittal are contained in Materials Method N.Y. 18.2.

M. Seals

Red tape seals imprinted "N.Y.S. D.o.T. Sampled" are used to provide security of packages containing samples submitted to the Department.

IV. Evidence of Acceptability

A. At the Manufacturing Plant

Appropriate copy of Form BR-240 in the possession of the Inspector, properly noted with the word "accepted" and validated by the Materials Bureau.

B. At the Project Site

1. Buff copy of Shipment Authorization Form BR195 with each delivery.
2. A validated green copy of Form BR-195 subsequent to the delivery.
3. Double Inspection Authority Stamp or one Inspection Authority Stamp with one "NYS DoT Accepted" stamp on each unit.

V. Drawing Approval & Inspection Assignment

<u>Responsibility</u>	<u>Action</u>
Contractor	<p>A. Submits to Deputy Chief Engineer (Structures) triplicate prints of preliminary shop drawings, drawn by the bearing manufacturer in accordance with the contract documents.</p>
Deputy Chief Engineer (Structures)	<p>B. Reviews the working drawings and returns one print to the manufacturer with approval or the required corrections indicated thereon.</p>
Manufacturer	<p>C. Makes the necessary corrections as indicated and when completed forwards the original tracing to the Deputy Chief Engineer (Structures).</p>

Subject: QUALITY ASSURANCE PROGRAM FOR PLAIN, STEEL LAMINATED, FABRIC LAMINATED AND SLIDING ELASTOMERIC BRIDGE BEARINGS

<u>Responsibility</u>	<u>Action</u>
Deputy Chief Engineer (Structures)	D. Reviews the completed tracing and if acceptable returns an approved print to the manufacturer for further distribution. (If unacceptable the tracing will be returned to the manufacturer for correction.)
Manufacturer	E. Transmits one paper print copy of the approved drawing to the Materials Bureau.
Manufacturer	F. Transmits two paper prints and one vellum reproducible of the approved drawing to the Department's Region office of project jurisdiction.
Materials Bureau	G. Assigns an Inspection Authority and forwards copies of the approved drawings to them with a letter detailing the specific bearing item(s) required.
Inspection Authority	H. Makes preliminary contact with the manufacturer. I. Schedules an inspection visit. J. Assigns an inspector to make the visit.
Inspector	K. Reviews the specification(s) and Quality Assurance procedure prior to an inspection visit. Questions should be directed to the Materials Bureau at (518) 457-5642.

VI. Inspection

The inspector shall have in his possession the letter assigning the inspector to perform Department inspection, the Department approved drawings, the specification and this Materials Method. The above references shall be utilized by the inspector in performing the required inspection services.

<u>Responsibility</u>	<u>Action</u>
Manufacturer	A. Manufactures all bearings to be included in a lot to be considered for Department acceptance. B. Arranges for a clean, well lighted location, at the manufacturing site for the inspector to evaluate all of the bearings to be considered for acceptance by the Department.

Subject: QUALITY ASSURANCE PROGRAM FOR PLAIN, STEEL LAMINATED, FABRIC LAMINATED AND SLIDING ELASTOMERIC BRIDGE BEARINGS

Responsibility

Action

Manufacturer

C. Maneuvers the bearings as required by the inspector to provide easy access for all measurements to be made.

D. Identifies indelibly each bearing on the side with the following minimum information.

1. Manufacturer's name
2. Department Contract Number D _____
3. Lot number - the manufacturer shall start with lot number 1 and number consecutively throughout the Calendar year.
4. Each individual bearing in the lot shall be numbered individually 1 through _____.

E. Prepares copies of the following certifications to give to the Inspector to accompany the samples selected by the inspector.

1. All steel, both external and internal indicating conformance to Department requirements.
2. A statement as to the domesticity of the steel as follows.
Domestic - Conforms to NYS EB 83-10 OR Foreign - Does not conform to NYS EB 83-10.
3. For sliding elastomeric bearings only: A statement from the manufacturer indicating sample sheets of Polytetrafluoroethylene (PTFE) and elastomer was from the same batch of material as used in the actual production of the bearings.

F. Determines that all bearings to be included in a lot have been manufactured and are present to inspect. Bearings not presented for inspection at this time are not to be included in this lot, even though they may be of the same size and shape; they will be considered as a separate lot(s) when presented for inspection.

Inspector

G. Measures, records and evaluates the gross dimensions of each bearing and the external load plates as detailed on the approved drawing.

Subject: **QUALITY ASSURANCE PROGRAM FOR PLAIN, STEEL LAMINATED, FABRIC LAMINATED AND SLIDING ELASTOMERIC BRIDGE BEARINGS**

ResponsibilityAction**Inspector**

- H. Measures and records the flatness of each sole (top) and masonry (bottom) plate utilizing the method as detailed on pages 12 & 13.
- I. Determines the parallelism of the fabric reinforcement or internal steel plates and individual layers of elastomer in accordance with the procedure as detailed on pages 14-16.
- J. Checks bearings to determine the manufacturer has identified each bearing as required by the specification.
- K. Places one inspection agency stamp on each bearing adjacent to the manufacturer's identifiers. This stamp will signify the bearings have been inspected.
- L. Notifies the Materials Bureau by telephone and the manufacturer when dimensions, including parallelism and laminate thicknesses do not meet Department requirements.

Materials Bureau

- M. Upon receipt of a telephone call from the inspector detailing deficiencies when they occur a decision will be made to either reject the bearings or continue with the procedure and our evaluation of the bearings.

Inspector

- N. Prepare a written report detailing the gross dimensions, laminate thickness and parallelism of all the bearings evaluated.

Inspection Agency

- O. The detailed written report is transmitted to the Materials Bureau within one working day from the date of inspection.

Subject: QUALITY ASSURANCE PROGRAM FOR PLAIN, STEEL LAMINATED, FABRIC LAMINATED AND SLIDING ELASTOMERIC BRIDGE BEARINGS

VII. Sampling and Testing

The sampling and testing procedures detailed below shall be performed in their entirety for bridge bearings of 650 square inches plan area or less. The sampling and testing procedures for bridge bearings of a plan area greater than 650 square inches will be conceptually the same as detailed below. The testing location however is subject to change.

The contractor shall notify the Materials Bureau of his intention to supply bridge bearings in excess of a 650 square inch plan area and request the Department's quality assurance procedure for those bearings.

Note: One sample bearing from each lot of Plain Elastomeric Bridge Bearings and Fabric Laminated Elastomeric Bridge Bearings will be destroyed during testing to determine specification compliance.

One sample bearing from each lot of Steel Laminated Elastomeric Bridge Bearings with bonded top and bottom load plates will be destroyed if a sample size of elastomer equivalent to twelve (12) 1" x 6" x 1/8" thick pieces cannot be removed from the sides of the sample bearings for evaluation.

The manufacturer shall allow for the above destructive testing in his production.

Responsibility

Action

Inspector

A. Selects samples at the rate detailed in the specific item of the Standard Specifications (a tabulated summary of the specified number of sample bearings is shown on page 17). The samples shall be selected by using the random number table found on page 27.

B. Completes Form BR-240, Sample and Acceptance Transmittal in accordance with Materials Method N.Y. 18.1: Examples of completed Form BR-240 are shown on pages 24 & 25. (Take special note of the example for Elastomeric Sliding Bearings Figure G which includes samples of PTFE and Elastomer.)

Subject: QUALITY ASSURANCE PROGRAM FOR PLAIN, STEEL LAMINATED, FABRIC LAMINATED AND SLIDING ELASTOMERIC BRIDGE BEARINGS

<u>Responsibility</u>	<u>Action</u>
Inspector	<p>C. For Elastomeric Sliding Bridge Bearings, obtains from the manufacturer the following sheets representing material incorporated in the bearings.</p> <ol style="list-style-type: none"> 1. One sheet of elastomer 10" x 15" (3/8" min., thickness) representing each lot. The manufacturer shall supply a certification indicating that the sample sheet was from the same batch of material as used in the actual production bearings. 2. One sheet of Polytetrafluoroethylene (PTFE) 10" x 15" of the thickness used on each lot of bearings. When PTFE of more than one thickness is used, a separate 10" x 15" sheet will be required for each thickness. The manufacturer shall supply a certification indicating the sample sheet(s) was from the same batch of material as used in the actual production bearings.
Manufacturer	<p>D. Securely packages the samples with the BR-240's enclosed in the BR-241 envelope and ships to the Materials Bureau at the expense of the Contractor.</p> <p><u>Note:</u> The packages containing the Elastomer and PTFE for Sliding Elastomeric Bearings shall be sealed by the inspector with Department tape seals.</p>
Materials Bureau	<p>E. Performs the required tests</p> <p>F. Determines appropriate action based on the results of the required tests.</p>

VIII. Acceptance/Rejection Action

<u>Responsibility</u>	<u>Action</u>
Materials Bureau	<p>A. Executes appropriate action on Form BR-240.</p>

Subject: QUALITY ASSURANCE PROGRAM FOR PLAIN, STEEL LAMINATED, FABRIC LAMINATED AND SLIDING ELASTOMERIC BRIDGE BEARINGS

Responsibility

Action

Materials Bureau

- B. Issues validated Form BR-240 to the Inspection Authority as described in Materials Method N.Y. 18.1.
- 1. Telephone request to the Materials Bureau in advance of normal notification will be only honored when received from the Inspector.
- C. Identifies accepted bearings by stenciling "NYS DoT Accepted" adjacent to the Inspection Agency Stamp.
- D. Holds rejected bearings until disposition is requested by the manufacturer. All shipments of these bearings will be at the manufacturer's expense.
- E. Receives validated copies of Form BR-240 and notifies the manufacturer of Department action.

Inspection Authority

- F. Each bearing accepted by the Department represented by the samples tested by the Materials Bureau shall be stamped with a second Inspection Agency stamp adjacent to the first.
- G. When the inspector informs the manufacturer that bearings have been rejected, no further action is required by the Inspection Agency.

IX. Shipping

The manufacturer shall not ship bridge bearings prior to acceptance by the Department. All shipments will be made as follows:

Responsibility

Action

Inspector

- A. Completes a Form BR-195, "Shipment Authorization" in accordance with Materials Method N.Y. 18.2 authorizing shipment of the balance of the bearings to the project site. (See Example, Figure I, page 26.)

Subject:

QUALITY ASSURANCE PROGRAM FOR PLAIN, STEEL LAMINATED, FABRIC LAMINATED AND SLIDING ELASTOMERIC BRIDGE BEARINGS

<u>Responsibility</u>	<u>Action</u>
Manufacturer	<p>B. Notifies the Materials Bureau of the address to ship the accepted bearings which are in the possession of the Materials Bureau as test samples.</p> <p>C. Ships the bearings accompanied with the buff (card) copy of Form BR-195.</p>
Materials Bureau	<p>D. Completes a Form BR-195 "Shipment Authorization" to the project site as designated by the manufacturer and ships the sample bearings at the Contractor's expense.</p> <p>E. Validates copies of Form BR-195 completed by the inspector and Materials Bureau to the Region office of project jurisdiction.</p>

Measuring Flatness of Steel Plates For Bridge Bearings

SCOPE: This method describes the specific procedure for measuring flatness of external steel plates for bridge bearings.

APPARATUS:

1. A precision straight edge, at least 1" longer than the dimension to be checked.
2. A feeler gauge capable of readings to the nearest 0.001". Note: Because "layering" of shim type feeler gauges tends to distort accuracy, a single blade shall be used whenever possible.

PROCEDURE:

1. Place the plate to be measured on a flat surface, uniformly supported, with the surface to be checked in a horizontal position. (Complete bridge bearing assemblies are considered to meet this requirement).
2. Plates shall be checked for flatness at the approximate center lines and also 1" from and parallel to, each outside edge, a total of six positions. The dotted lines in Figures A & B show where the straight edge shall be held.
3. Position the straight edge as parallel to the central axis of the plate as possible. On a surface with a raised center, it will be necessary to temporarily shim the straight edge for stability. See Figure B.
4. Hold the blade of the straight edge perpendicular to the surface at the predetermined locations, with adequate pressure to hold it in position. Attempt to slide the desired blade of the feeler gauge between the surface being measured and the straight edge, along the entire length of the piece. On sole plates, the areas within 1" of the edges parallel to the center line of the girder will not normally be in bearing and need not be checked. (Figure "A"). Check drawings if in doubt. Masonry plates will be checked across the entire area.
5. If the specified blade thickness will freely slide under the straight edge at any location, the inspector shall notify the manufacturer of the "out of flat" condition and the Materials Bureau to request the appropriate action. The results of testing shall be included in the written report transmitted to the Materials Bureau (include actual out of spec measurements).

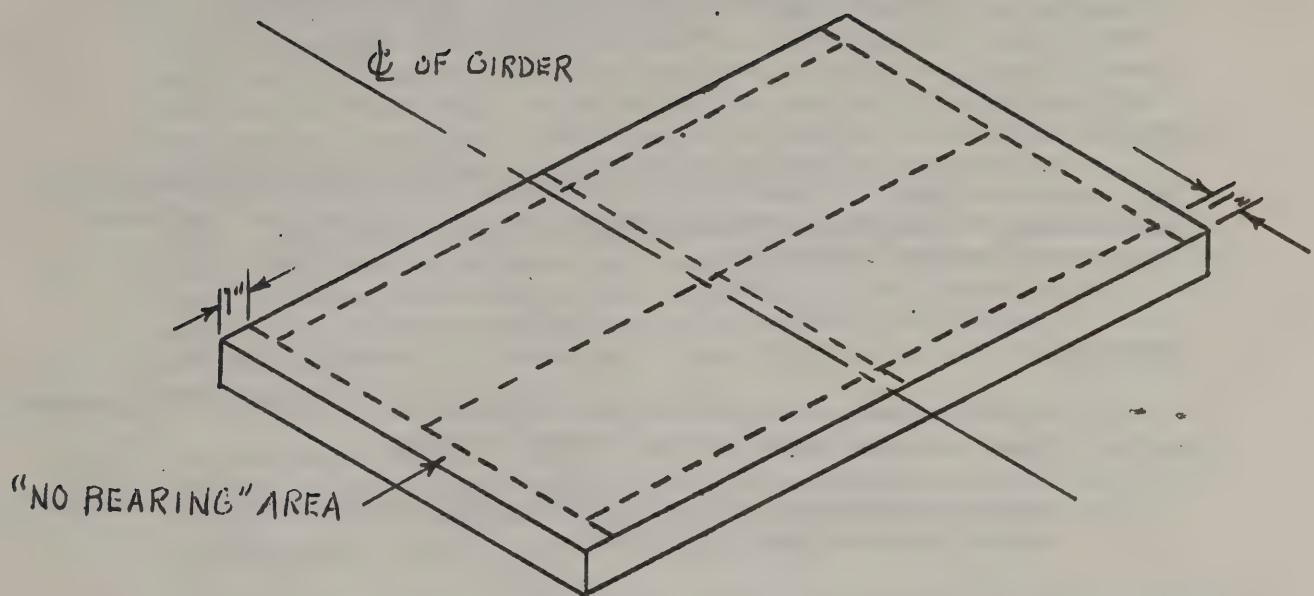

FIGURE "A", SOLE PLATE

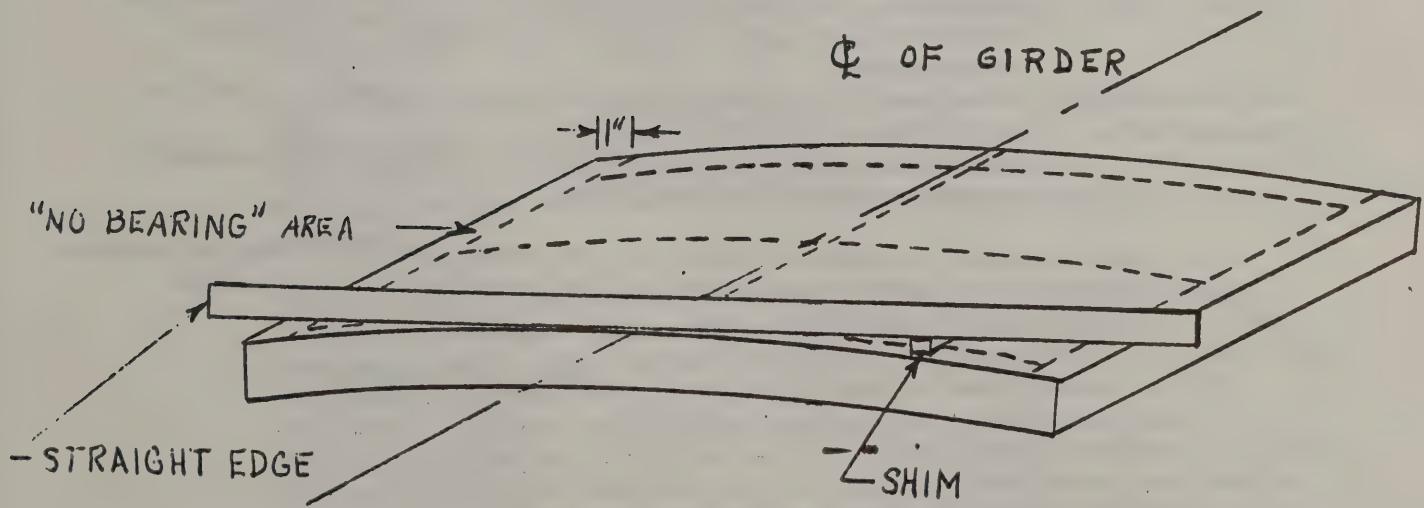

FIGURE "B" SOLE PLATE

**Measuring Laminate Thickness and Parallelism
For Bridge Bearings**

SCOPE:

This procedure shall be used for determining the laminate thickness and parallelism of internal steel plates or fabric, of steel or laminated elastomeric bridge bearings.

APPARATUS:

1. A device such as a grinder used to remove thin strips of elastomer from the edge cover of the bridge bearings.
2. Calipers graduated to 0.01 inches and/or dividers and a machinist's scale graduated to 0.01 inches.

PROCEDURE:

1. Locate the shape factor, effective rubber thickness (ERT) and individual laminate thicknesses on the shop drawings as approved by the Deputy Chief Engineer (Structures).
 - A. The shape factor must be 12.0 or less to utilize this procedure. If the shape factor is greater than 12.0, the inspector shall call the Materials Bureau for further instructions.
 - B. Calculate 75% of the Effective Rubber Thickness (ERT) to determine specification limits.
 - C. Calculate $\pm 20\%$ of the individual laminate thicknesses to determine specification limits.
2. The inspector randomly selects the required number of sample bearings by using the random number table found on page 27. The sample schedule is as follows:

Lot Size	Number of Samples
1-4	All
5-16	4
17-20	5
21-24	6
25-28	7
29-32	8
33-36	9
37-40	10
41 or greater	1 additional bearing for every 4 in the lot

Note: Whenever possible, the bearings sampled for parallelism and laminate thickness measurements shall not be included in the random selection of bearings submitted to the Materials Bureau for testing. The sampling rate for bearings submitted to the Materials Bureau is as detailed in the Standard Specifications for the appropriate item.

3. For Steel Laminated Bridge Bearings ONLY, the manufacturer grinds off or removes a thin strip of elastomer along the vertical surface of the bearing at four points located 90° apart about the perimeter. For rectangular bearings this will be the midpoint of each side exposing the internal steel plates through the bearings thickness. The ground strip shall be as narrow as possible to minimize the exposure of the steel plates, yet wide enough to accurately locate the plates and measure the laminate thickness between them.

Note: For small size bearings or small lots (i.e. 4 bearings or less) care should be taken to preserve an area on one bearing of at least 6 inches in length by the full bearing thickness such that a sample of elastomer can subsequently removed for testing by the Materials Bureau. If necessary, the grinding of one side of the bearing may be omitted.

4. The inspector measures and records the thickness of each elastomeric laminate at the four quarter-point perimeter locations. Vernier calipers or dividers and a machinist scale shall be used and measurements recorded to the nearest 0.01".

For steel laminated bearings, the thickness of the elastomer shall be measured between the individual steel laminates or between the top or bottom edge of the bearing to the first adjacent steel laminate. (See examples 1 and 2 pages 19 and 20). For fabric laminated bearings, the thickness of the elastomer shall be measured from the approximate midpoint of the double ply fabric to the midpoint of the next adjacent double ply fabric laminate or the top or bottom edge of the bearing to the midpoint of the first double ply fabric laminate. (See examples 3 and 4 pages 21 and 22.)

Note: Only working laminates will be evaluated to determine the parallelism of the internal steel plates and fabric reinforcement. Occasionally a bearing is designed with a bedding layer that is not a working laminate and therefore should not be included in the evaluation.

Bedding layers can be identified by referring to the Department approved drawings. The bedding layer when included, will be the outermost layer (top, bottom or both). To determine if those layers are bedding layers, total the thickness of all layers of the elastomer as shown on the drawings rounding the sum off to the nearest 0.01 inches. If the total is equal to the Effective Rubber Thickness (ERT) as detailed on the drawing all layers are working laminates and shall be included in the parallelism determination. When the sum is greater than the ERT subtract the thickness of one or both of the outermost layers to determine which should be deleted to evaluate only working laminates.

Should the inspector have any questions on a specific bearing pad of working laminate versus bedding layer, please contact the Materials Bureau at (518) 457-5642.

5. For determining the parallelism of steel plates and fabric reinforcement, the inspector will record the smallest measured thickness of each layer from the four quarter point locations which is defined as the working laminate thickness and proceed as follows:
 - a. Determine the sum of the working laminate thickness for each bearing evaluated.
 - b. The total working laminate thickness shall be equal to or greater than 75% of the ERT.
 - c. If the total is less than 75% of the ERT, the inspector shall notify the Materials Bureau immediately requesting appropriate action. (See Examples 2, page 20.)
6. For determining the laminate thickness, the inspector will calculate the average of the four measurements for each laminate and proceed as follows:
 - a. Compare the average thickness with the laminate thickness detailed on the approved drawing applying a \pm 20% tolerance.
 - b. If the average exceeds the \pm 20% tolerance, the inspector shall notify the Materials Bureau immediately requesting the appropriate action. (See Example 4, page 22.)
7. Record and report all individual measurements and calculations to the Materials Bureau. (See Examples 1-4 on pages 19-22.)

Samples Required for Materials Bureau Testing

Item	Sample
716-02, Plain Elastomeric Bridge Bearings	Three (3) full size bearings per size per contract.
716-04, Steel Laminated Elastomeric Bridge Bearings	One (1) full size bearing per every five in each size category, per project, per production run, a minimum of three (3) bearings.
716-08, Elastomeric Sliding Bridge Bearings	One (1) full size bearing per every five in each size category, per project, per production run, a minimum of three (3) bearings.
	One 10" x 15" (3/8", minimum thickness) sheet of elastomeric material per project, per production run.
	One 10" x 15" sheet of PTFE material per project per production run.
716-10, Fabric Laminated Elastomeric Bridge Bearings	One (1) full size bearing per every five in each size category, per project, per production run, a minimum of three (3) bearings.

Example of Steel Laminated and Fabric Laminated Bridge Bearings

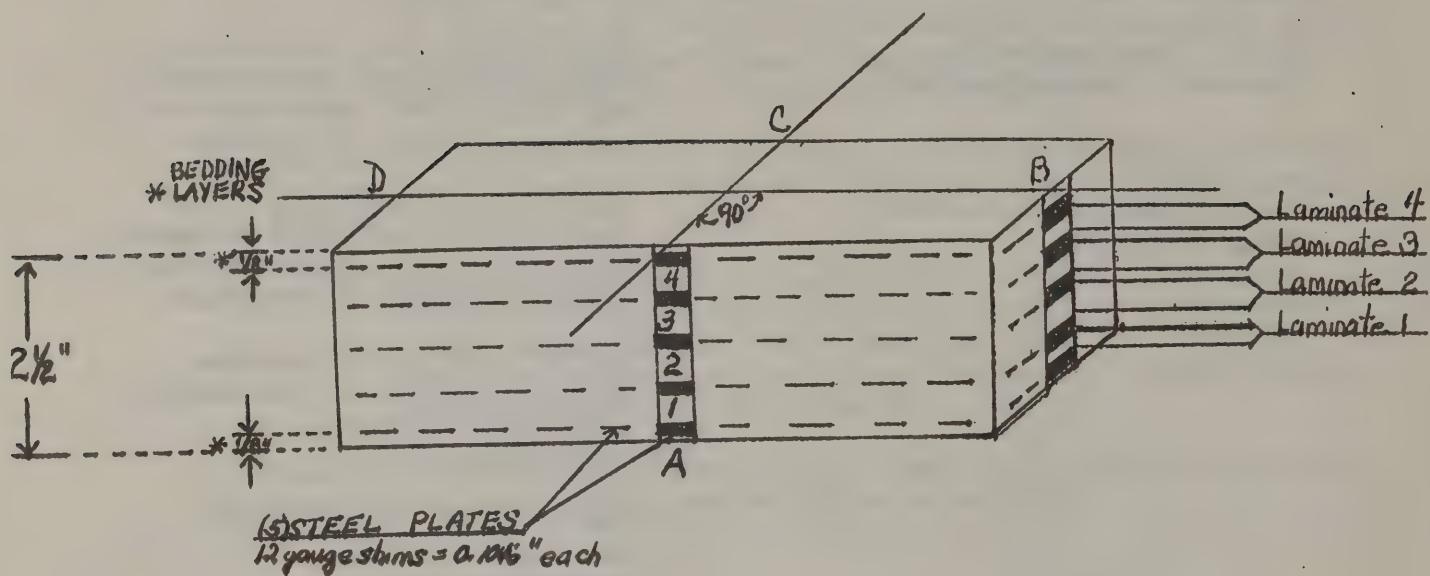

Figure C
Steel Laminated Elastomeric Bridge Bearing

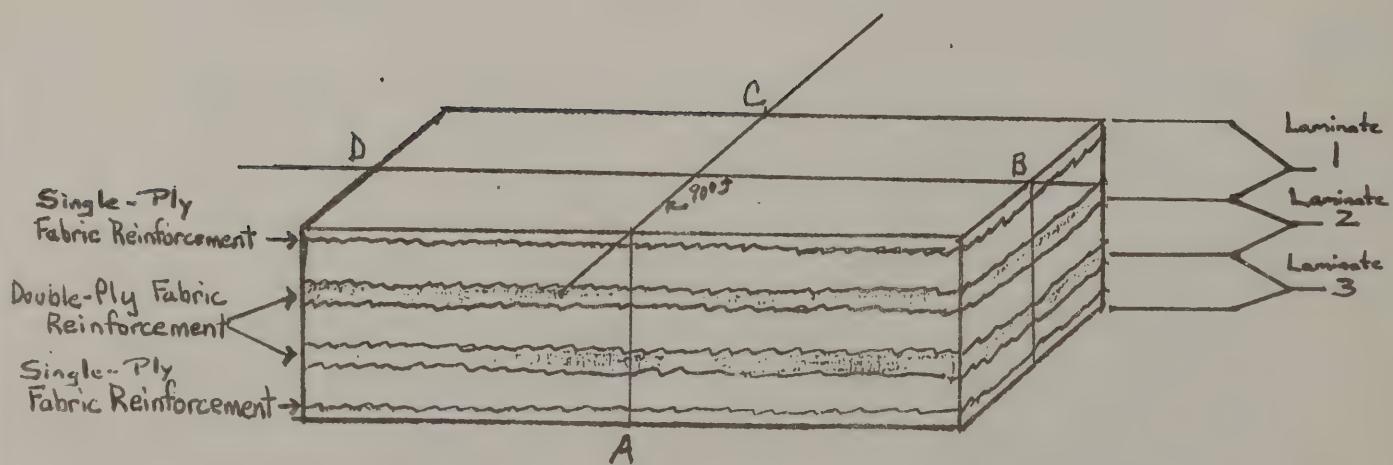

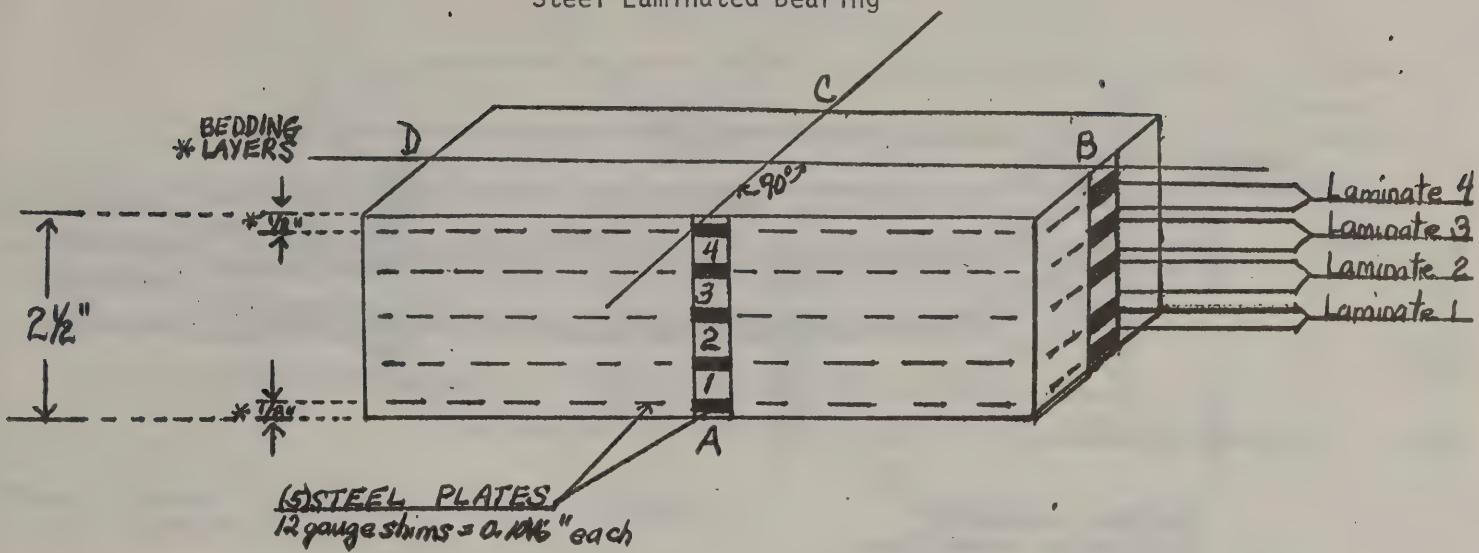

Figure D
Fabric Laminated Elastomeric Bridge Bearing

Steel Laminated Bearing

EXAMPLE 1

Contract No. D250000
Shop Drawing No. US-285

Lot No. 6
Pad No. 9

ERT = 1.73"
Laminate Thickness = ERT/4 = 0.43"

75% ERT = 1.30"
Laminate Thickness \pm 20% = 0.34" to 0.52"

Measurements 0.01"

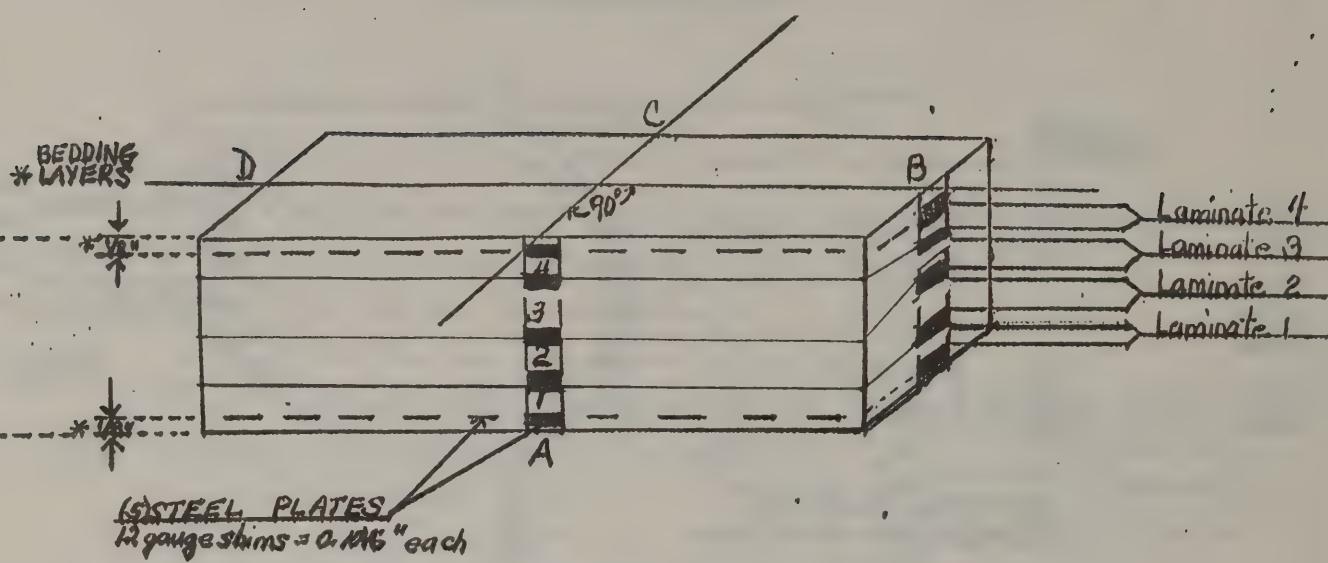

Laminate	Side A	Side B	Side C	Side D	Working Thickness (Lowest of 4 Sides)	Average of Four Sides
1	0.36	0.37	0.50	0.34	0.34	0.39
2	0.48	0.39	0.42	0.36	0.36	0.41
3	0.35	0.49	0.37	0.48	0.35	0.42
4	0.42	0.35	0.34	0.49	0.34	0.40
					1.39" Total	

The above number exceeds 1.30" (75% ERT).

Therefore this bearing has acceptable plate parallelism.

Each of the above recorded measurements are within the tolerance range of 0.34"-0.52". Therefore this bearing has acceptable laminate thickness.

Steel Laminated Bearing

Example 2

Contract No. D250000
Shop Drawing No. US-285

Lot No. 6
Pad No. 3

$$\text{ERT} = \frac{1.73}{4} = 0.43"$$

$$75\% \text{ ERT} = \frac{1.30}{4} = 0.325"$$

$$\text{Laminate Thickness} \pm 20\% = 0.34" \text{ to } 0.62"$$

Measurements 0.01"

Laminate	Side A	Side B	Side C	Side D	Working Thickness (Lowest of 4 Sides)	Average of Four Sides
1	0.19	0.47	0.60	0.38	0.19	0.41
2	0.50	0.46	0.35	0.42	0.35	0.43
3	0.34	0.34	0.43	0.37	0.34	0.37
4	0.24	0.42	0.51	0.48	0.24	0.41
					1.12 Total	

The above number is less than 1.30" (75% ERT).

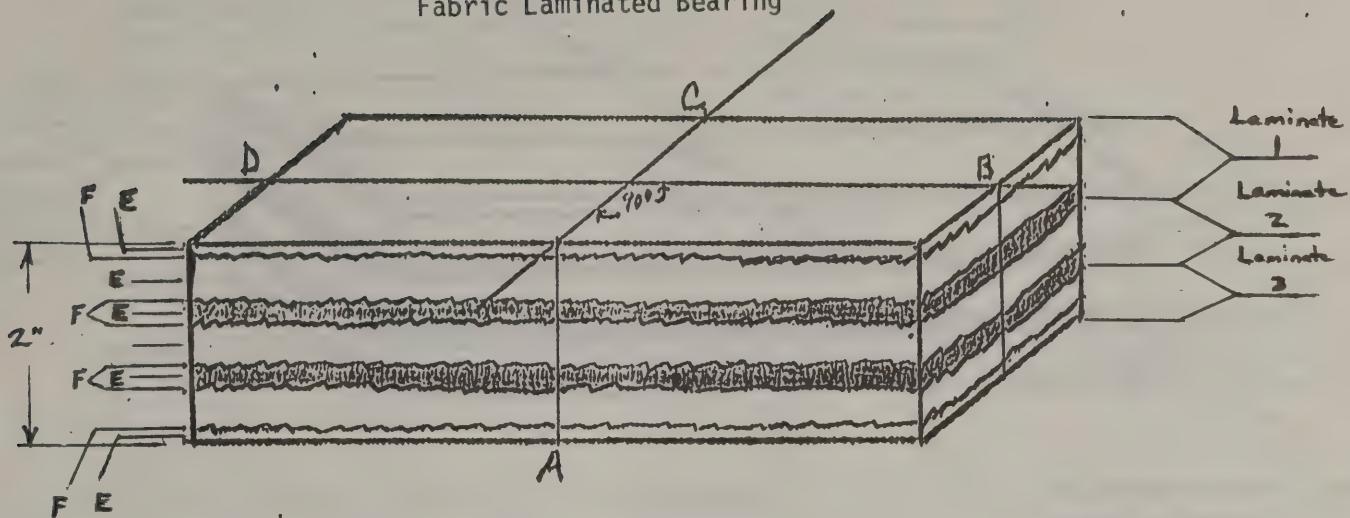

Therefore this bearing has unacceptable plate parallelism. The inspector shall notify the Materials Bureau immediately requesting appropriate action.

Each of the above recorded measurements are within the tolerance range of 0.34" - 0.52".

Therefore this bearing has acceptable laminate thickness.

Fabric Laminated Bearing

21

Note: F denotes Fabric
E denotes Elastomer

Example 3

Contract No. D250000

Shop Drawing No. US-243

Lot No. 10

Pad No. 2

ERT = 2.00"

Laminate Thickness = ERT/3 = 0.67"

75% ERT = 1.50"

Laminate Thickness \pm 20% = 0.54-0.80"

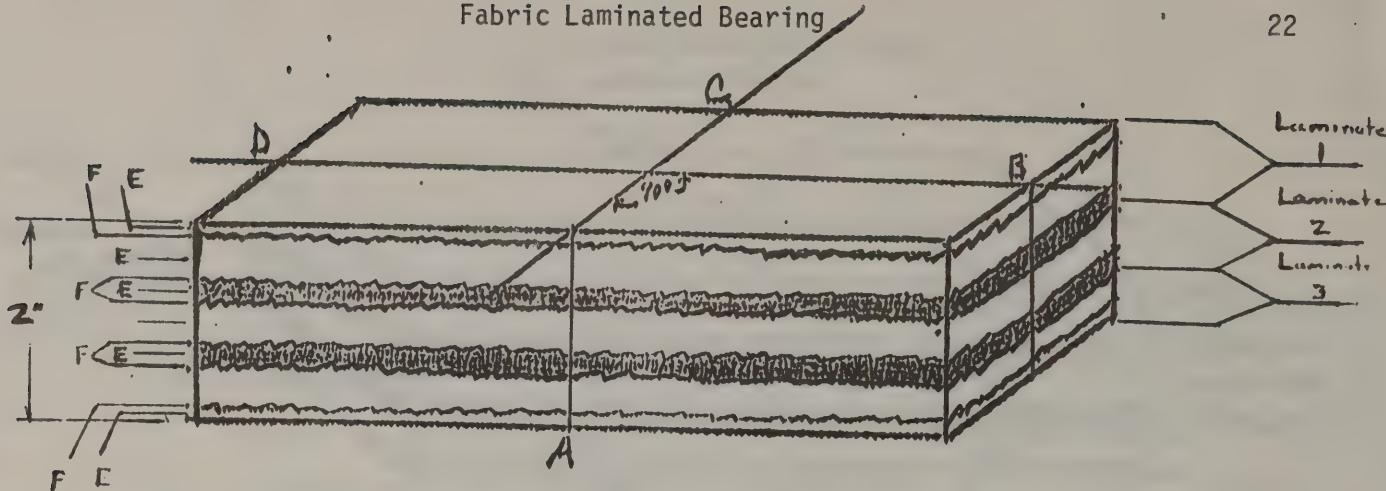

Measurements 0.01"

Laminate	Side A	Side B	Side C	Side D	Working Thickness (Lowest of 4 Sides)	Average of Four Sides
1	0.63	0.69	0.63	0.67	0.63	0.66
2	0.68	0.64	0.68	0.65	0.64	0.66
3	0.65	0.65	0.64	0.65	0.64	0.65

1.91" Total

The above number exceeds 1.50" (75% ERT).
Therefore this bearing has acceptable Fabric parallelism.

Each of the above recorded measurements are within the tolerance range of 0.54" - 0.80".
Therefore this bearing has acceptable laminate thickness.

Note: F denotes Fabric
E denotes Elastomer

Example 4

Contract No. D 250 000
Shop Drawing No. US-243

Lot No. 10
Pad No. 12

ERT = 2.00"

Laminate Thickness = ERT/ = 0.67"

75% ERT = 1.50"

Laminate Thickness \pm 20% = 0.54"-0.80"

Measurements 0.01"

Laminate	Side A	Side B	Side C	Side D	Working Thickness (Lowest of 4 Sides)	Average of Four Sides
1	0.35	0.40	0.35	0.40	0.35	0.38
2	0.78	0.80	0.80	0.77	0.77	0.79
3	0.65	0.65	0.67	0.68	0.65	0.66

1.77" Total

The above number 1.50" (75% ERT).
Therefore this bearing has acceptable fabric parallelism.

0.38" is not within the tolerance range of 0.54"-0.80". The inspector shall notify the Materials Bureau immediately requesting appropriate action.

INSTRUCTIONS:

1. Determine number of digits to be used that correspond with number of units to be sampled. (e.g. 500 units - use last three digits of each number in the table - 9685) 27

2. Starting anywhere in the table, select the units to be sampled by reading the numbers consecutively that do not exceed total number of units in the lot.

(EXAMPLE - 500 units to be sampled with 5 samples needed. Presume you start on line 27, column 3 (#685). Since 685 is larger than the number of units in lot, go down col. 3 selecting numbers 64, 32, 187, 37 and 110. When counting units in lot, those units corresponding to these numbers would be sampled.)

RANDOM NUMBER TABLE
